

Enrollment & Outpatient Visit Processing Pipeline

A Python workflow that converts monthly enrollment records into continuous enrollment periods, validates span logic, and enriches each period with outpatient-utilization measures.

CHALLENGE

Monthly enrollment files are often stored at a grain that is not directly useful for period-based utilization analysis.

SOLUTION

A repeatable workflow that creates validated enrollment spans, attaches utilization metrics, and produces analysis-ready outputs.

WORKFLOW

WHAT IT DEMONSTRATES

- Date standardization and chronological sorting
- Business-rule logic for continuous enrollment spans
- Patient-level period construction from recurring files
- Visit enrichment tied to each valid enrollment period

BUILT-IN QA

- Optional step-by-step validation outputs
- Continuity checks for span logic
- Logging for traceable processing
- Versionable, repeatable workflow structure

OUTPUT

Analysis-ready enrollment periods with total outpatient visits and distinct visit-day measures.

CSV results file

QA files

VALUE

Replaces manual period construction with documented processing logic that can be rerun as new files arrive.

Reproducible

Handoff-ready
